

Uraniumletter INTERNATIONAL

the international independent information and advice bulletin for uranium resource investments

Overviews as at July 31, 2020

Marino G. Pieterse, publisher and editor

- ▶ **Cameco to restart Cigar Lake at the beginning of September and targeting in total 5.3 million pounds U3O8, but not to be sold into oversupplied stock market; Kazatomprom drawing down inventory rather than buying into the market**
- ▶ **Overlooking 154 reactors to be closed by 2040 and 280 new ones coming on stream, anticipated future growth of uranium demand by the market is strongly overstated**

OVERVIEW of U3O8 PRICES

► Uranium Market Annual Report 2019

According to the **U.S. Energy Information Administration (EIA)** owners and operators of U.S. civilian nuclear power reactors (civilian owner/operators or COOs) **purchased a total of 48 million pounds U3O8e (equivalent)** of deliveries from suppliers and foreign suppliers during 2019, **at a weighted-average price of \$ 35.59 per pound U3O8e**. The 2019 total of 48 million pounds U3O8e was 20% higher than the 2018 total of 40 million pounds U3O8e and the average price of \$ 35.59 per pounds U3O8e was 8% lower than the 2018 weighted-average price of \$ 38.81 per pounds U3O8e.

Similar to recent years, the vast majority of uranium delivered in 2019 was of foreign-origin. Uranium originally in **Kazakhstan, Russia and Uzbekistan** accounted for 42% of total uranium purchased by U.S. COOs in 2019. **Canadian-origin uranium and Australian-origin together accounted for 39%**.

COOs purchased three material types of uranium for 2019 delivery from 35 sellers one less seller than in 2018. **During 2019, 22% of the uranium delivered was purchased under spot contracts at a weighted-average price of \$ 27.89 per pound. The remaining 78% was purchased upon long-term contracts at a weighted-average price of \$ 37.73 per pound.**

► New and future uranium contracts

In 2019, COOs signed 34 new purchase contracts with deliveries under contract to allow for the option of either decreasing or increasing quantities.

At the end of 2019, the maximum uranium deliveries for 2020 through 2029 under existing purchase contracts for COOs totaled 181 million pounds U3O8e. Also, at the end of 2019, unfilled uranium market requirements for 2020 through 2029 totaled 207 million pounds U3O8e.

These contracts deliveries and unfilled market requirements combined represent the maximum anticipated requirements of 388 million pounds U3O8e over the next 10 years for COOs.

► Uranium feed

In 2019, COOs delivered 38 million pounds U3O8e of natural uranium feed to the U.S., and foreign enrichers. U.S. enrichment suppliers received 51% of the feed and the remaining 49% was delivered to foreign enrichment suppliers.

Uranium in fuel assemblies loaded into the U.S. civilian nuclear power reactors during 2019 contained 43.2 million pounds U3O8e compared with 50.4 million pounds U3O8e loaded during 2018.

During 2019, 9% of the uranium loaded was U.S. origin and 91% was foreign origin uranium.

► Uranium foreign purchases/sales and inventories

U.S. suppliers (brokers, converters, enrichers, fabricators, producers and traders) and COOs, purchase uranium each year from foreign suppliers. **Together, foreign purchase totaled 429 million pounds U3O8e in 2019 and the weighed-average price was \$ 34.77 per pounds U3O8e.**

U.S. suppliers and COOs also sold uranium to foreign suppliers. Together foreign sales totaled 11.7 million pounds U3O8e in 2019 and the weighted-average price was \$ 27.16 per pounds U3O8e.

Year-end commercial uranium inventories represent ownership of uranium in different stages of the nuclear fuel cycle (in process for conversion, enrichment or fabrication) at domestic or foreign nuclear fuel facilities. **Total U.S. commercial inventories** (including inventories owned by COOs, U.S. brokers, converters, enrichers, fabricators, producers and traders) **were 127.1 million pounds U3O8e at the end of 2019, down 3% from 130.5 million pounds at the end of 2018.**

► Shift in geological blocks dictates international uranium market

At prices of \$ 32.70 and \$ 35.50, respectively on July 31, 2020, **China, Russia** and **India** together are currently accounting for 23 reactors under construction and 82 reactors planned, representing 51% and 76% respectively of the world total. With the required uranium to feed future operational reactors, this is broadly seen as the key driver of a strong uranium price recovery.

It should be realized however, that China's and Russia's required uranium supply is mainly covered by long-term supply agreements, in particular with Kazakhstan.

This actually means that expectations on a revival of the USA uranium industry is wishful thinking.

Based on the current supply situation, with the **USA** with 95 reactors almost hosting 22% of the world's 439 operable reactors and this year requiring 19,746 tonnes uranium (29% of the world total of 68,240 tonnes), it is notable that **Russia** supplies approximately 45% of US imports of enriched uranium and **Canada** approximately 90% of natural uranium imports.

This means that for the USA there is no urgent need to lower current imports of more than 95% of the uranium it uses for other than international political tensions.

Considering that globalization is creating a new economic world order, it is noteworthy to see which countries are supplying uranium. This is of crucial importance for the course of uranium pricing, as it demonstrates that the long-awaited strong recovery to a pre-Fukushima price level of \$ 65-70/lb to enable an economically viable production is factually not justified.

Anticipating a strong growth of nuclear reactors under construction and of planned reactors, led by China, Russia and India, one has to know through which countries supply of required uranium is met, notably Kazakhstan, Australia, Namibia and Niger.

From this perspective, I refer to my overview of geographical strategic blocks, that shows that Kazakhstan based at a production of 28,808 tonnes in 2019, is not only by far the world's biggest uranium supplier but can easily fully feed growing uranium market demand from Russia, without any effect on the uranium price.

In addition, part of the USSR block, **Kazakhstan** and **Russia** also are in a strategic position to trade uranium with other strategic blocks that are facing deficits in supply. In this respect, it is also of interest to know that uranium export to the USA is partly provided through Canada to escape an import ban of uranium supply from Russia. Also, there is a possibility to export uranium to the USA via Cameco's 40% interest in the **JV Inkai** and 60% owned by **Kazatomprom** as at January 1, 2018.

No reliable insight in current stocks exists for **Japan**, where required uranium from the anticipated restart of nuclear reactors probably to be fully met by still available reserves from before the Fukushima accident in March 2011. Currently, **Japan** is operating 9 reactors and 17 reactors are in the process of restart approval.

Concerning **South Korea**, the deficit of 4,594 tonnes uranium can be provided by different international sources. Noteworthy is the growing anti-nuclear sentiment in the country, which may result in a significant reduction of the current share of approximately 30% of total electricity generating.

Europe has no own sources of uranium supply. First production is expected to come from Berkeley Energia's Salamanca mine in 2021. With a share of 70.6% of total electricity generating, **France** is the biggest generator of nuclear energy in Europe.

- **Kazakhstan** supplies 46% of the world's totally required uranium in 2019, mainly covered by long-term delivery contracts, including to the **USA**

Overview of strategic geopolitical uranium blocks

	Uranium production 2019 (tonnes U)	in %	Uranium required 2019 (tonnes U)	Surplus (+) Deficit (-) x

Top 11 in % world total		79		61	82	85

x Future reactors envisaged in specific plans and proposals and expected to be operating by 2030

* **France** generates 71.6% from its electricity from nuclear energy. To be more balanced through an increase of renewables, this share may be reduced to 50% or approximately 40 reactors by 2025

** **South Korea's** 2017 elected government has introduced strongly opposed nuclear phase-out plans by 2040; nuclear production to drop from 31% today to 22% by 2030

*** Up until 2011, **Germany** obtained 25% of its electricity from its 17 nuclear reactors, but nuclear energy phased out in 2011 when 8 reactors shut down immediately and currently 7 remaining reactors to be closed by 2019

**** Up until 2011, **Japan** was generating some 30% of electricity from its 55 reactors and this was expected to increase to at least 40% by 2017. The plan is now for at least 20% by 2030 from a depleted fleet. Currently, 42 reactors are operable, with 9 having restarted since, 18 reactors are currently in the process of restart approval

New plants coming online are largely balanced by old plants being retired. Over 1996-2018, 89 reactors were retired as 98 started operations. The reference scenario in the 2019 edition of The Nuclear Fuel Report has 154 reactors closing by 2040 and 289 new ones coming online, including 22 restarted Japanese reactors

source : WNA

► Reactor shutdowns outweigh start-ups in 2019

In January 2020, the **World Nuclear Association** reported that global nuclear generation stood at 392.4 GWe net at the end of 2019, down slightly from 2018, according to their data. Six power reactors were added to the grid last year and construction of three large projects started, Nine units were permanently shiw down.

► Six New nuclear reactors with a combined generating capacity of 5,241 MWe came online in 2019.

Two of those – Taishan 2 and Yangjian 6 were in **China**. Unit 4 of **South Korea's** Ushin Kori plant was also connected to the grid, as was **Russia's** Novoronezh II unit 2. Russia's first floating nuclear power plant, the Akademik Lomonosov - comprising two 32 MWe reactors – was also connected to the grid towards the end of the year.

In 2018, 10,420 MWe of new nuclear generating capacity was connected to the grid, while 3,345 MWe was added in 2017.

► Power uprates of existing reactors also added 212 NWe of generating capacity during 2019.

Some 35 MWe was added at the Embalse plant in **ArgEntina**, while 155 MWe and 22 MWe were added at **USA's** Browns Ferry 2 and Peach Bottom 2 units, respectively.

In comparison, four uprates in the **USA** added 350 MWe of capacity in 2018.

► **Construction** was started last year of three new power reactors: unit 2 of the Kursk II plant in Russia; unit 1 of China's Zhangzhou plant; and unit 2 of Iran's Buser plant.

► **Nine more reactors with a combined capacity of 5,976 MWe were officially shut down in 2019.**

These were Bulibino 1 in Russia, Chinshan 2 in Taiwan, Genkai 2 in Japan, Mühleberg in Switzerland, Philippsburg 2 in Germany, Pilgrim in the USA, Ringhals 2 in Sweden and Three Mile Island 1 in the USA. South Korea's Wolsong plant, which had not operated since June 2018, was declared as having been shut down on December 24, 2019.
